Batter Board Survey of Factory Site Using LN-150

Simgeum-a Construction Co., Ltd. is a professional construction company that builds villas, efficiency apartments, and factories, established in May 2021 and has several sites in the metropolitan area.

Simgeum-a was looking for equipment to purchase a Total Station in October 2021, when they were introduced to the LN-150, they decided that the LN-150 would be better to be auto-leveling and auto-tracking than a regular Total Station, and finally purchased the LN-150.

We visited the Hwaseong site of Simgeum-a and met CEO Jae-eun, Ha.

He said he is 100% satisfied with the LN-150 and is using it well.

And He said three things about the LN-150. The first is that it is possible to reduce the labor costs by one-man surveying, and the second is that it is convenient and efficient to operate the equipment because it can be automatically leveled and tracked. Third, we can check the exact location in real time, so we can reduce the amount of turret loss.

And he said the overall speed of the operation was five times faster.

He also said that the price was a bit high at the time of the initial purchase, but after using the LN-150 for eight months, he thought it was not expensive at all, and that he had already saved money from labor costs and ready-mixed concrete volume.

He said that it is a necessary equipment for construction sites and that it should be distributed to more sites, and that he recommends the LN-150 around him.
